

GSQA v2.7 Now Available - Reduces Material Risk

Supplier Quality Assurance Expands Into Supply Chain Quality Management Assuring Inbound Materials Are Safe and Perform as Specified

Chicago, IL (PRWEB) June 11, 2010 -- EMNS, Inc. (www.gsqa.com), a leader in supplier quality management solutions for forward-thinking companies with mission-critical dependency on their inbound supply chain materials, announces the availability of GSQA v2.7 that furthers the manageability of complex supply chain quality and supplier quality assurance.

GSQA Version 2.7 is being deployed immediately at two Fortune 1000 companies in the process and discrete manufacturing industries. Although these companies are very different in their finished products, manufacturing technologies, supply chain topologies, material specifications and global locations, what they do have in common is the requirement to monitor and track pertinent quality metrics throughout their multi-tier supply chains for contaminated, counterfeit, non-conforming materials and non-compliant suppliers. GSQA v2.7 provides both firms visibility across global locations (suppliers and plants) for material validation including e-COA analysis, non-conformance management, supplier performance, certifications and regulatory documentation compliance.

In both cases GSQA was selected to model their complex supply chains, and provide a high-security and high-availability web-based system for data entry, analysis and centralization of all material quality data and to integrate with SAP. Managing the quality data in each tier of the supply chain will enable both companies to lower material variability that is an ongoing challenge to all manufacturing operations and provide forward/backward traceability with key data elements only a click away.

Benefits will include "one version of the truth" across global operations, reduced quality and procurement administrative costs and increased plant productivity from a smoother operating supply chain. Their customers gain benefits from more consistency of inbound product quality and improved optimization of their production processes.

About EMNS, Inc.

For over ten years EMNS, Inc. has been a leading provider of SaaS quality solutions used in forty countries around the world. From its newly constructed, state-of-the-art data center in the Chicago suburbs EMNS offers business intelligence to operations, regulatory compliance, procurement and quality departments in Fortune 1000 companies. The multi-language, global data management of GSQA enhances quality visibility across EMNS customers' plants and supply bases, improves supplier performance and lowers material variability so our customers can efficiently produce consistently high-quality finished products.
